Longer-term outlook and milestones

Descriptive projection; not forced to meet targets.

Benchmark: 70% national standard. 16.0pp above milestone

Data: NHS England two-hour urgent community response. **Targets:** Two-hour urgent community response standard

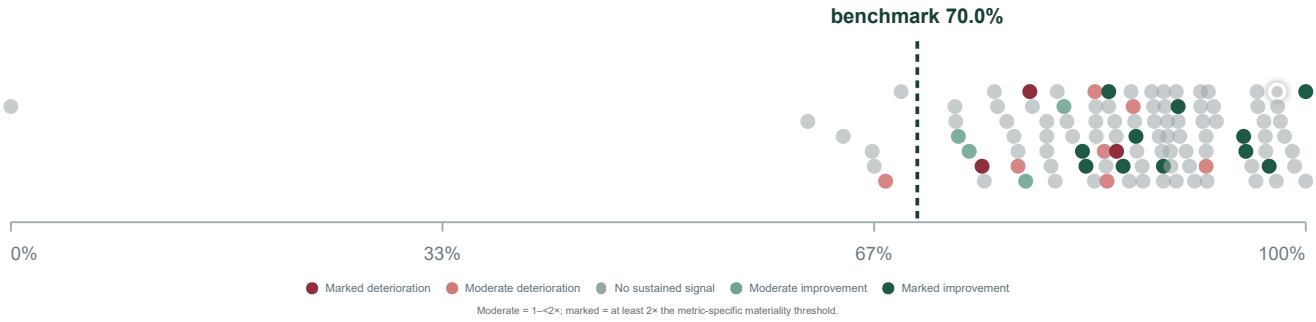

Method: Backtest-weighted ensemble of current-level seasonal movement, damped annual drift and a damped recent seasonal trend; at least 2 components are required. The final fit uses 54 consecutive months. Accuracy is tested on 18 rolling one-month-ahead forecasts. The 80% range uses empirical historical error quantiles from 18 forecast errors. Weights use inverse rolling RMSE and are shrunk toward equal weights. The pre-release commentary compares the current-level seasonal component with the combined forecast. Provider distribution and trajectory watch are shown on page 2.

Two-hour urgent community response

Distribution and trajectory watch · September 2026

Provider distribution

Latest reported performance across providers. This is a comparison of current levels, not a measure of whether each provider is improving or deteriorating.

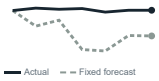

Trajectory watch

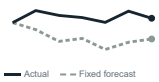

Six actual months are compared with one forecast path fixed before that window. Both lines begin at the same observed value. A low performer can be improving, while a high performer can be deteriorating. Status: Actual performance is compared with the monthly path forecast six months earlier. The displayed figure is the latest actual minus the fixed forecast for that same month; the six-month window checks persistence.

LATEST MONTH: BELOW FORECAST

Trajectory-watch rule. Six actual months are compared with the corresponding path fixed before the six-month window. The displayed gap is the latest actual minus the fixed forecast for that same month. A signal requires a material latest-month gap and at least five of six months in that direction. These are screening prompts—not league tables, causal estimates or judgements of provider quality.
