Recent performance and current release

The vertical band is the empirical 80% expected range.

Longer-term outlook and milestones

Descriptive projection; not forced to meet targets.

Benchmark: 95% constitutional standard; planning milestones shown on the chart.

Data: NHS England A&E attendances and emergency admissions. **Targets:** Medium Term Planning Framework.

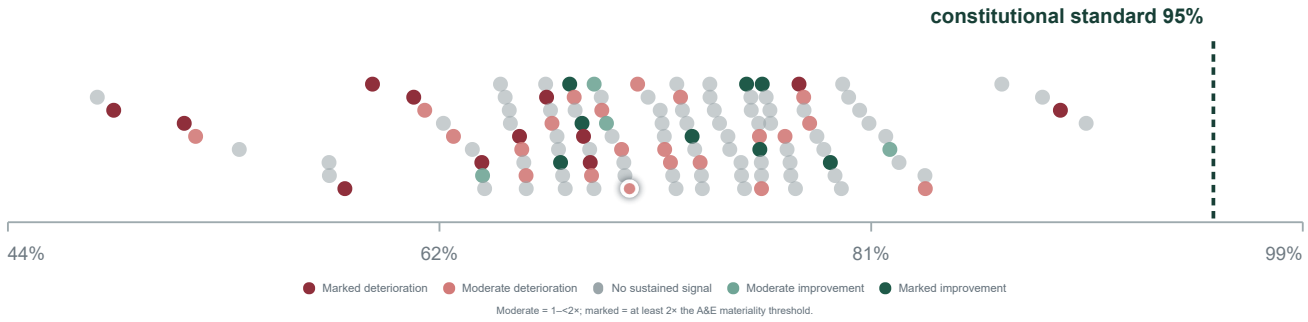

Method: Fixed equal-weight ensemble of same-month persistence, damped annual drift and a shared-season current-era trend, with empirical forecast-error ranges. The pre-release commentary compares the seasonal component with the two trend-bearing components. Provider distribution and trajectory watch are on page 2.

A&E four-hour performance

Distribution and trajectory watch · October 2026

Provider distribution

Latest reported performance across providers. This is a comparison of current levels, not a measure of whether each provider is improving or deteriorating.

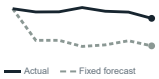

Trajectory watch

Six actual months are compared with one forecast path fixed before the window. Both lines begin at the same observed value. The displayed gap is the latest actual minus the fixed forecast for that same month. A low performer can be improving, while a high performer can be deteriorating.

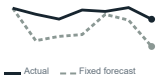

120	12	34	74
providers assessed	sustained favourable	sustained adverse	without an active signal

Sustained adverse signals outnumber favourable signals (34 versus 12). Most providers (74 of 120) do not meet the active six-release threshold.

Latest 61.3% · 6 of 6 months in this direction · Active
Forecast fixed before the six-month window

-7.9pp
LATEST MONTH: BELOW FORECAST

Trajectory-watch rule. The latest 6 actual months are compared with a path fixed before that window. The displayed gap is the latest actual minus the fixed forecast for that same month. Its magnitude must be at least 2.0pp, and at least 5 of 6 months must point in that direction. These are screening prompts—not league tables, causal estimates or judgements of provider quality.
