Category 2 ambulance response

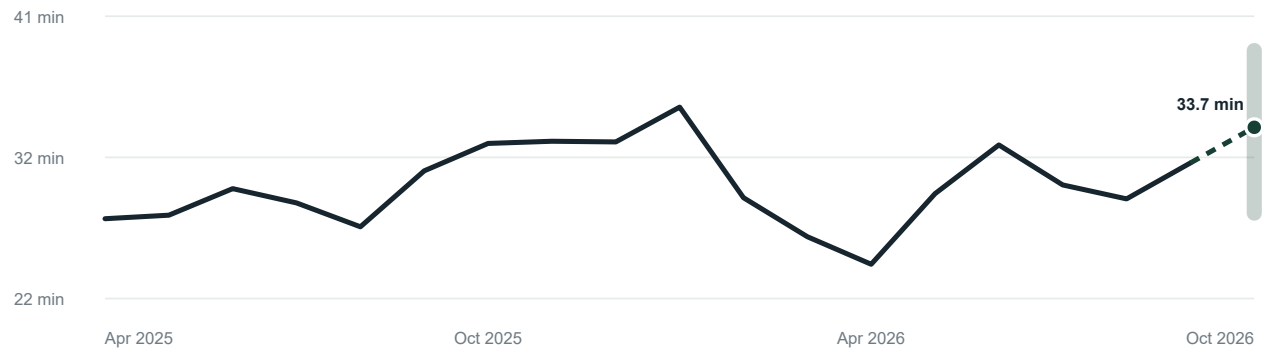

Forecast for October 2026 · data through September 2026

The latest Category 2 ambulance response result was 31.3 min. For the next release, it is expected to worsen to 33.7 min. The model's expected deterioration is mainly due to the usual month-to-month seasonal movement, partly offset by an improving underlying trend. The current projection is off course for 25 minutes during 2026/27. Across providers, sustained adverse signals outnumber favourable ones (3 to 1).

LATEST · SEPTEMBER 2026	FORECAST · OCTOBER 2026	MAR 2027 TARGET OUTLOOK
31.3 min	**33.7 min**	Projected **25.4 min**
0.4 min above forecast	80% expected range 27.9 min–38.9 min	Target **≤25 min**
		49% Model-implied chance

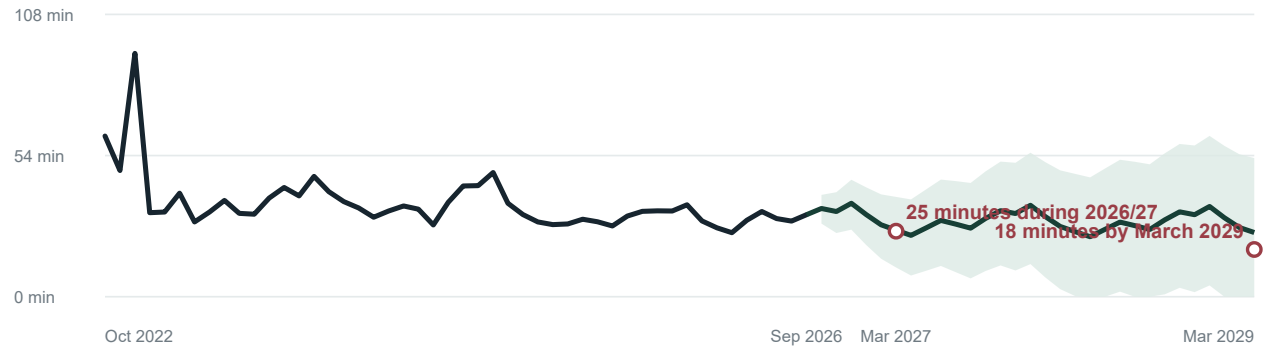

Recent performance and next release

The vertical band is the 80% expected range.

Longer-term outlook and milestones

Descriptive projection; not forced to meet targets.

Benchmark: 18-minute standard. 0.4 min above milestone

Data: NHS England Ambulance Quality Indicators. **Targets:** Medium Term Planning Framework interim target · Medium Term Planning Framework final target

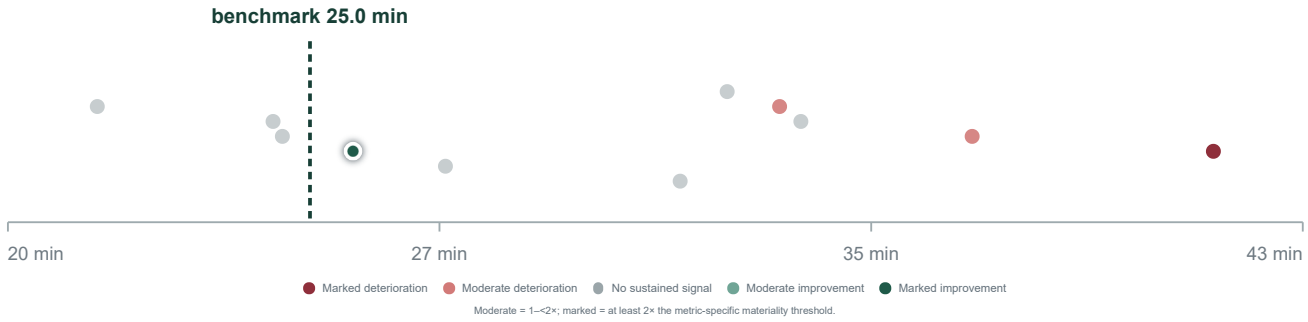

Method: Backtest-weighted ensemble of current-level seasonal movement, damped annual drift and a damped recent seasonal trend; at least 2 components are required. The final fit uses 110 consecutive months. Accuracy is tested on 36 rolling one-month-ahead forecasts. The 80% range uses empirical historical error quantiles from 36 forecast errors. Weights use inverse rolling RMSE and are shrunk toward equal weights. The pre-release commentary compares the current-level seasonal component with the combined forecast. Provider distribution and trajectory watch are shown on page 2.

Category 2 ambulance response

Distribution and trajectory watch · September 2026

Provider distribution

Latest reported performance across providers. This is a comparison of current levels, not a measure of whether each provider is improving or deteriorating.

Trajectory watch

Six actual months are compared with one forecast path fixed before that window. Both lines begin at the same observed value. A low performer can be improving, while a high performer can be deteriorating. Status: Actual performance is compared with the monthly path forecast six months earlier. The displayed figure is the latest actual minus the fixed forecast for that same month; the six-month window checks persistence.

Forecast fixed before the six-month window

4.5 min

LATEST MONTH: ABOVE FORECAST

Trajectory-watch rule. Six actual months are compared with the corresponding path fixed before the six-month window. The displayed gap is the latest actual minus the fixed forecast for that same month. A signal requires a material latest-month gap and at least five of six months in that direction. These are screening prompts—not league tables, causal estimates or judgements of provider quality.
