Two-hour urgent community response

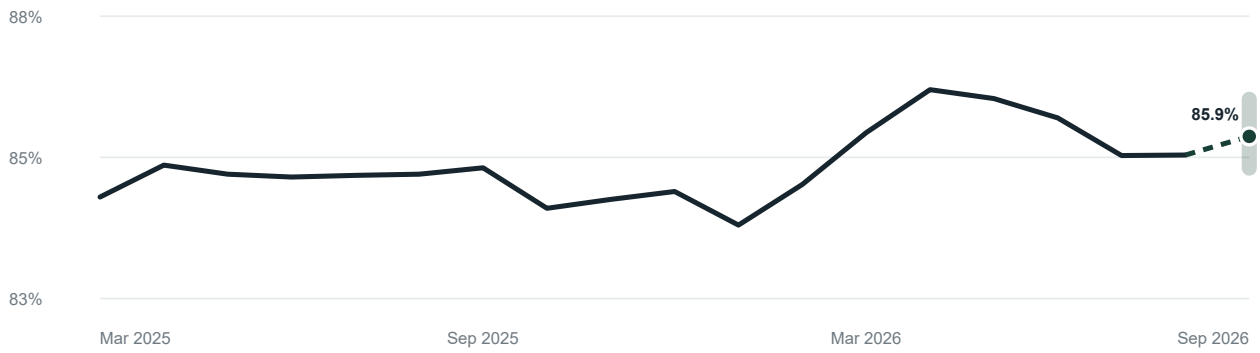

Forecast for September 2026 · data through August 2026

The latest Two-hour urgent community response result was 85.5%. For the next release, it is expected to remain broadly stable at 85.9%. Current-level seasonal and underlying-trend effects are small or offsetting, leaving the outlook broadly stable. The current projection is on trajectory for 70% national standard. Across providers, sustained favourable signals outnumber adverse ones (16 to 11).

Data: NHS England two-hour urgent community response. **Targets:** Two-hour urgent community response standard

Method: Backtest-weighted ensemble of current-level seasonal movement, damped annual drift and a damped recent seasonal trend; at least 2 components are required. The final fit uses 53 consecutive months. Accuracy is tested on 18 rolling one-month-ahead forecasts. The 80% range uses empirical historical error quantiles from 18 forecast errors. Weights use inverse rolling RMSE and are shrunk toward equal weights. The pre-release commentary compares the current-level seasonal component with the combined forecast. Provider distribution and trajectory watch are shown on page 2.

Two-hour urgent community response

Distribution and trajectory watch · August 2026

Provider distribution

Latest reported performance across providers. This is a comparison of current levels, not a measure of whether each provider is improving or deteriorating.

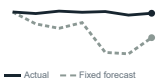

Trajectory watch

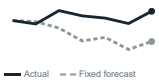

Six actual months are compared with one forecast path fixed before that window. Both lines begin at the same observed value. A low performer can be improving, while a high performer can be deteriorating. Status: Actual performance is compared with the monthly path forecast six months earlier. The displayed figure is the latest actual minus the fixed forecast for that same month; the six-month window checks persistence.

Trajectory-watch rule. Six actual months are compared with the corresponding path fixed before the six-month window. The displayed gap is the latest actual minus the fixed forecast for that same month. A signal requires a material latest-month gap and at least five of six months in that direction. These are screening prompts—not league tables, causal estimates or judgements of provider quality.
