Category 2 ambulance response

Provider distribution and trajectory signals · data through October 2026

The latest release has been incorporated into the provider screen. 11 providers can be assessed across six consecutive releases. Adverse signals outnumber favourable signals, 3 to 1.

Provider distribution

Latest reported performance across providers. This shows current levels; it is separate from whether a provider has improved or deteriorated relative to its own trajectory.

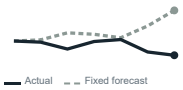

Trajectory watch

Each provider's six actual months are compared with one forecast path fixed before that window. Both lines begin at the same observed value. The displayed gap is the latest actual minus the fixed forecast for that same month. A low performer can therefore be improving, while a high performer can be deteriorating. Status: Actual performance is compared with the monthly path forecast six months earlier. The displayed figure is the latest actual minus the fixed forecast for that same month; the six-month window checks persistence.

4.3 min
LATEST MONTH: ABOVE FORECAST

LONDON AMBULANCE SERVICE NHS TRUST
Latest 31.9 min · 6 months compared with a path fixed six months earlier
Forecast fixed before the six-month window

4.0 min
LATEST MONTH: ABOVE FORECAST

Trajectory-watch rule. Six actual months are compared with one path forecast before the six-month window. The sparkline begins at the shared observed starting value, then shows how actual performance diverged from that fixed path. The displayed gap is the latest actual minus the fixed forecast for that same month. A signal requires a material latest-month gap and at least five of six months in that direction. These are screening prompts—not league tables, causal estimates or judgements of provider quality.
