Provider distribution and trajectory signals · data through August 2026

The latest release has been incorporated into the provider screen. 48 providers can be assessed across six consecutive releases. Favourable signals outnumber adverse signals, 9 to 8.

Provider distribution

Latest reported performance across providers. This shows current levels; it is separate from whether a provider has improved or deteriorated relative to its own trajectory.

Trajectory watch

Signals show sustained departures from each provider's own archived outlook. A low performer can be improving, and a high performer can be deteriorating. The archive is still building; signal rows state whether they use archived release forecasts, a historical backtest, or both. Status: Actual performance is compared with the monthly path forecast six months earlier. The displayed figure is the average gap across those six months.

Trajectory-watch rule. Six consecutive release surprises are compared with forecasts made before each release. A signal requires a material average gap, at least five of six months in the same direction, and the latest month confirming that direction. These are screening prompts—not league tables, causal estimates or judgements of provider quality.
