Recent performance and current release

The vertical band is the 80% expected range.

Longer-term outlook and milestones

Descriptive projection; not forced to meet targets.

Benchmark: 92% constitutional standard, 4.0pp below milestone
Data: NHS England referral to treatment waiting times. **Targets:** Medium Term Planning Framework national target · Medium Term Planning Framework final target
Method: Backtest-weighted ensemble of current-level seasonal movement, damped annual drift and a damped recent seasonal trend; at least 2 components are required. The final fit uses 229 consecutive months. Accuracy is tested on 36 rolling one-month-ahead forecasts. The 80% range uses empirical historical error quantiles from 24 forecast errors. Weights use inverse rolling RMSE and are shrunk toward equal weights. The pre-release commentary compares the current-level seasonal component with the combined forecast. Provider distribution and trajectory watch are shown on page 2.

Distribution and trajectory watch · July 2026

Provider distribution

Latest reported performance across providers. This is a comparison of current levels, not a measure of whether each provider is improving or deteriorating.

Trajectory watch

Signals show sustained departures from each provider's own archived outlook. A low performer can be improving, and a high performer can be deteriorating. Status: Actual performance is compared with the monthly path forecast six months earlier. The displayed figure is the average gap across those six months.

139 providers assessed	79 sustained favourable	10 sustained adverse	50 without an active signal

Trajectory-watch rule. Six actual months are compared with the corresponding path fixed before the six-month window. A signal requires a material average gap, at least five of six months in the same direction, and the latest month confirming that direction. These are screening prompts—not league tables, causal estimates or judgements of provider quality.
