A&E four-hour performance

Forecast for October 2026 · data through September 2026 · issued 2026-10-08

National all-types performance fell by 0.7pp over the three months to September 2026, reaching 74.4%. The October 2026 forecast is 74.9%, 0.5pp above the latest result. The model's expected improvement is mainly driven by the underlying trend; the seasonal effect is small. The reference projection reaches 76.9% by March 2027, 5.1pp below the 82% interim milestone.

		10.1pp below the 85% 2028/29 milestone

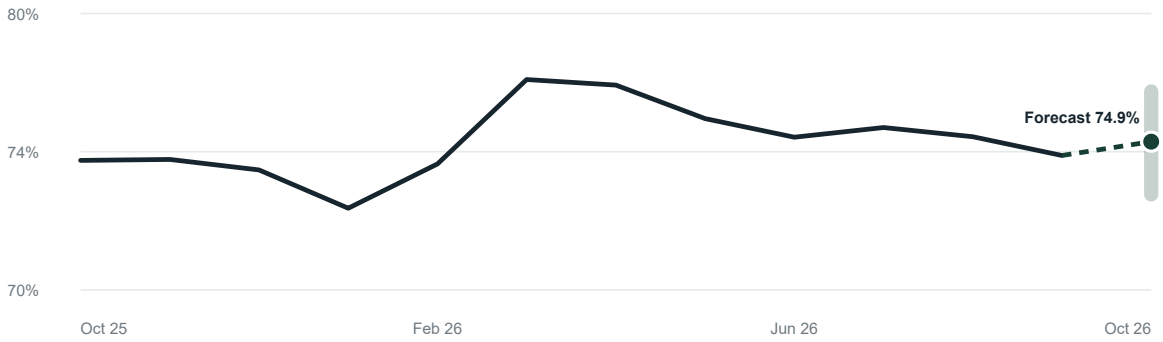

WHAT CHANGED?

Demand was higher than a year earlier and performance weakened: the pattern is consistent with demand rising faster than processing and flow capacity.

Attendances	Seen within 4 hours	Breaches
5.8%	4.9%	8.7%

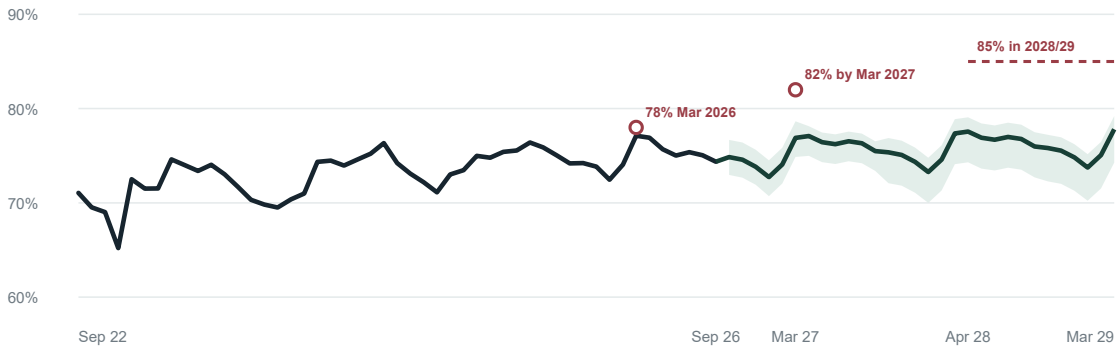

Recent performance and next release

The vertical band is the empirical 80% expected range.

Longer-term outlook and milestones

Descriptive projection; not forced to meet targets.

Benchmark: 95% constitutional standard; planning milestones shown on the chart.

Data: NHS England A&E attendances and emergency admissions. **Targets:** Medium Term Planning Framework.

Method: Fixed equal-weight ensemble of same-month persistence, damped annual drift and a shared-season current-era trend; all three components are required. The final fit uses 191 months. Accuracy is tested on 16 rolling one-month-ahead forecasts. The 80% range uses 81 empirical current-era forecast errors. The pre-release commentary compares the seasonal component with the two trend-bearing components. Provider distribution and trajectory watch are on page 2.

A&E four-hour performance

Distribution and trajectory watch · September 2026

Provider distribution

Latest reported performance across providers. This is a comparison of current levels, not a measure of whether each provider is improving or deteriorating.

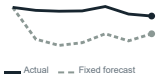

Trajectory watch

Six actual months are compared with one forecast path fixed before the window. Both lines begin at the same observed value. A low performer can be improving, while a high performer can be deteriorating.

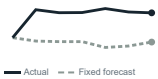

120	14	33	73
providers assessed	sustained favourable	sustained adverse	without an active signal

Sustained adverse signals outnumber favourable signals (33 versus 14). Most providers (73 of 120) do not meet the active six-release threshold.

-6.8pp
WORSE THAN FIXED PATH

Trajectory-watch rule. The latest 6 actual months are compared with a path fixed before that window. The average gap must be at least 2.0pp, at least 5 of 6 months must point in the same direction, and the latest month must confirm it. These are screening prompts—not league tables, causal estimates or judgements of provider quality.
