Cancer treatment within 62 days

Forecast for September 2026 · data through August 2026

The latest Cancer treatment within 62 days result was 71.9%. For the next release, it is expected to worsen to 69.7%. The model's expected deterioration is mainly due to the usual month-to-month seasonal movement; the underlying trend is broadly flat. The current projection is off course for 80% by March 2027. Across providers, sustained favourable signals outnumber adverse ones (29 to 25).

LATEST · AUGUST 2026	FORECAST · SEPTEMBER 2026	ACTUAL
71.9%	**69.7%**	—
1.2pp above forecast	80% expected range 68.0%–71.1%	Not yet released
		Off course · 80% by March 2027

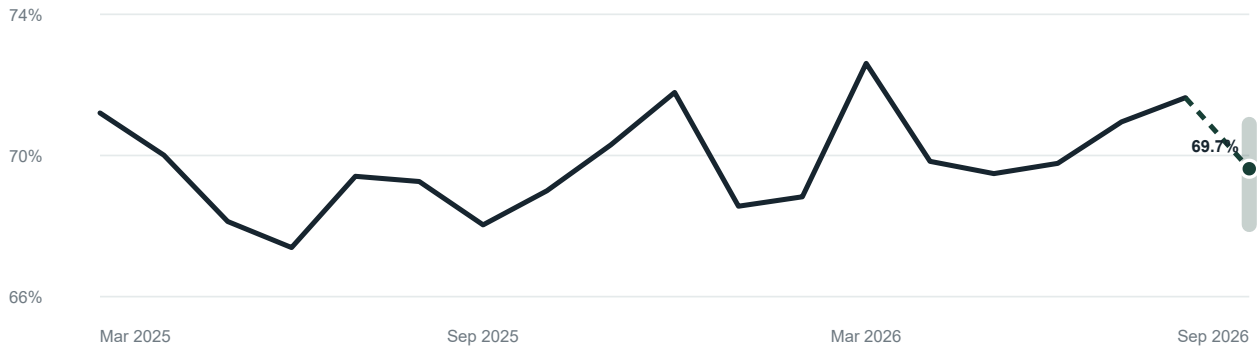

WHAT CHANGED?

Cancer treatment within 62 days improved in the latest month. Treatments in the published cohort changed by -3,610, while Treatments within 62 days changed by -2,362. The percentage therefore reflects both the size of the cohort and how many were within the standard.

Monthly	Annual	Treatments in the published cohort

Longer-term outlook and milestones

Descriptive projection; not forced to meet targets.

Benchmark: 85% constitutional standard. 6.0pp below milestone

Data: NHS England cancer waiting times. **Targets:** Medium Term Planning Framework interim target · Medium Term Planning Framework final target

Method: Backtest-weighted ensemble of current-level seasonal movement, damped annual drift and a damped recent seasonal trend; at least 2 components are required. The final fit uses 53 consecutive months. Accuracy is tested on 24 rolling one-month-ahead forecasts. The 80% range uses empirical historical error quantiles from 24 forecast errors. Weights use inverse rolling RMSE and are shrunk toward equal weights. The pre-release commentary compares the current-level seasonal component with the combined forecast. Provider distribution and trajectory watch are shown on page 2.

Distribution and trajectory watch · August 2026

Provider distribution

Latest reported performance across providers. This is a comparison of current levels, not a measure of whether each provider is improving or deteriorating.

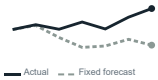

Trajectory watch

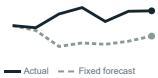

Six actual months are compared with one forecast path fixed before that window. Both lines begin at the same observed value. A low performer can be improving, while a high performer can be deteriorating. Status: Actual performance is compared with the monthly path forecast six months earlier. The displayed figure is the average gap across those six months.

8.2pp
WORSE THAN FIXED PATH

Trajectory-watch rule. Six actual months are compared with the corresponding path fixed before the six-month window. A signal requires a material average gap, at least five of six months in the same direction, and the latest month confirming that direction. These are screening prompts—not league tables, causal estimates or judgements of provider quality.
